

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

1. MFA needs to be implemented to require employees to sign in using a password, and 2 or more methods (phone number, email, etc.) verification.
2. Stronger password requirements and separate passwords for each employee must also be required.
3. Setting up, testing and performing updates to the firewall frequently.

Part 2: Explain your recommendations

1. This will significantly help with brute force issues.
2. This will significantly help with brute force issues.
3. This will assist in making sure the front lines of the network and servers are protected against attacks.
